

UVA Deloitte Capstone Final Deliverable Options

November 13, 2024

1. Publication Paper

- **Purpose:** To formally present the findings of the project and analysis of various LLM evaluation frameworks, adding to academic and industry discourse
- **Structure:** The publication will serve to be a very in-depth discussion of the topic and findings of the project. This will consist of a review on existing literature or knowledge, methodology, analysis results, and discussion of comparative analysis on frameworks
- **Target Audience:** Deloitte internal teams (though may be a bit dense for such use), as well as other academics or professionals in the area. The paper could be submitted to the Systems and Information Engineering Design Symposium (SIEDS) conference or similar
- **Benefits:** This option adds significant credibility compared to the others
- **Challenges:** This option may require a more rigorous analysis, literature review, and overall peer review process, which can be time-consuming given the timeline.

2. Handbook

- **Purpose:** To provide a practical, comprehensive guide for practitioners and researchers who want to evaluate LLMs or choose the right framework for their needs
- **Structure:** The handbook would serve more as an overall solution/project documentation. The document would be slightly more high-level on certain topics to enforce the practicality of it. It could have sections like introduction to LLMs, framework descriptions, evaluation criteria, case studies, best practices, and guidance on selecting the right framework for specific goals
- **Target Audience:** Deloitte internal teams, or any team Deloitte wants to share such information with
- **Benefits:** This option provides a more practical and usable document for Deloitte. Having the handbook can not only inform internal teams on the entire project, but also be used as a quick guide when needing to choose an evaluation framework or immediate knowledge
- **Challenges:** Creating a handbook requires extensive knowledge synthesis and clear organization, as well as keeping the content accessible for a broad range of experience levels
- **Examples:**
 - https://support.google.com/a/users/answer/9259748?visit_id=638067150216618701-2587085935&hl=en&rd=1

3. Dashboard / Application

- **Purpose:** To create an interactive tool that users can leverage to compare or evaluate LLMs based on selected criteria or frameworks
- **Structure:** A web-based interface that lets users select and apply different evaluation frameworks to test models, see visual comparisons, and generate reports and narratives. In addition to showing the metrics calculated by each framework, the tool can provide textual insights on what frameworks better in what situation. There is potential to use generative AI to accept user input in this tool and provide a text output on framework analysis and recommendations
- **Target Audience:** Technical and non-technical members of Deloitte's teams interested in an intuitive way to evaluate LLMs and frameworks without diving into the underlying code and analysis
- **Benefits:** This option would likely be the most usable option overall for Deloitte. Users of the tool wouldn't require as much technical expertise or understanding of the analysis to gain knowledge. The tool can be deployed for organizational use in a much more unified way than the paper or handbook can likely achieve
- **Challenges:** This will require a greater number of requirements to be established for the project. Maintenance and updates may also be required to support new evaluation frameworks or models moving forward
- **Examples:**
